The diazonium salt of 5-fluorouracil (F-DA) was evaluated for its anticancer activity in three mammalian cell lines (HeLa, HL-60, and KB-3-1) and one avian cell line (F-10). In mammalian cell lines the IC₅₀ of F-DA for HeLa and HL-60 were 0.005 and 0.01 mg/mL, respectively. In the avian cell line, the IC₅₀ of F-DA was 0.01 mg/mL. HeLa cells were significantly inhibited by exposure to F-DA for 2 h, whereas at 4 and 8 h F-DA-induced cell death was more profound. Expression of various proteins was examined in treated cells, the most prominent of which was the induction of p53 protein, which increased at 1 h. Nuclear alterations, including chromatin condensation and fragmentation of the DNA, appeared at 1 h and decreased at later time points, except for KB-3-1 cells which showed a pattern similar to that of the cells treated with N-Nitrosodiethylamine. The activity of F-DA in vitro may represent at least in part the activity of this drug in vivo, and the data presented above provide a foundation for investigations of the mechanistic basis of its activity. www.geekyglass.ca Glitter Snow and Copper by Roseanne Grimaldi Another stunning design from Roseanne Grimaldi - this time in copper and glitter snow!
